TI    Cells expressing multimerizing chimeric transcription factors and target
      genes controlled by said factors and their use in gene therapy
SO    PCT Int. Appl., 44 pp.
      CODEN: PIXXD2
IN    Gilman, Michael Z.
AB    A cell contg. a first DNA construct encoding a chimeric, ligand-binding
      responder protein and a target gene whose transcription is controlled by
      said responder protein is disclosed.  Expression of the target gene is
      activated by multimerization of the responder protein by the ligand.  The
      responder protein is comprised of a ligand-binding domain and a
      heterologous transcription-activating domain.  Thus, recombinant cells
      capable of regulatable expression of genes for thrombospondin,
      angiostatin, sol. VEGF receptor, a dominant neg. form of VEGF,
      tumor-specific antigen, or cytokine can be used to treat or prevent
      cancer.  Similarly, recombinant cells with regulatable expression of a
      gene for .beta.-interferon can be used to treat or prevent multiple
      sclerosis, and those with a regulatable gene for a ribozyme or antisense
      nucleic acid against HIV, to treat or prevent HIV infection.
